EDITORIAL NOTICE

Discoverers of numbered minor planets, as well as others suggesting names for them, are reminded that the citations accompanying the names are now restricted to a maximum of four printed lines in the *Minor Planet Circulars* (excluding the line giving the discovery information), or about 50 words. For a few months after this change was made last July (see *MPC* 35155), it seemed that many of the citations being submitted complied with this requirement, but the lengths are now creeping up again. A short citation that restricts its content to the actual name itself, rather than covers matters only indirectly associated with the name, is preferred. It should be written in good English, including sufficient information to explain the meaning of the name, but excluding details that cause it to read like a potted biography or travelogue. In the case of a name honoring a person, years of birth (and death) should be provided, and some explicit geographical information (e.g., the city in which the person lives or worked, rather than nationality) can be useful. It would also be very helpful to the Minor Planet Center if contributors submitted their name proposals by e-mail, in straight ASCII and *not* in any packed form or as the coded output of a word processor, using the format shown—with examples—at <http://cfa-www.harvard.edu/iau/info/Astrometry.html#cit>; diacritical marks should be indicated using the TeX convention. All names submitted will require the approval of the IAU Small Bodies Names Committee before they can be published. Names may be subject to further modification, generally for the purpose of making them more distinct from existing names, and citations are subject to further editing.

For the first time, this batch of *MPCs* contains observations and orbital elements of some natural satellites. Since they can be quite routinely observed in the course of survey observations for minor planets, the Minor Planet Center quite frequently receives reports of observations of the outer satellites of the giant planets. Although such observations are usually quickly recognized by the MPC, it does sometimes happen that they accidentally receive preliminary minor-planet designations (cf. *MPC* 38243). In any case, it seems desirable to make these observations available to the community. Furthermore, there is a particular need for the systematic publication of absolute astrometric observations of newly discovered satellites, such as the three outer satellites of Uranus reported in 1999, given that there has been room on the *IAU Circulars* only for a few representative data. For convenience, the corresponding orbital elements are given here in “comet” form, in the same units of AU, degrees and degrees per day (though with the period P in years), except that T and q of course refer to the planetocenter, rather than to the heliocenter.

Quite apart from this addition, however, it has been apparent recently that the *MPCs* are nowadays becoming almost unreasonably large, with three mailings sometimes necessary to accommodate a monthly batch, and the actual observations of the minor planets contained in a *Supplement* series that is being disseminated only electronically. The volume of data is typically now ten times what it was only three years ago, and more new minor planets can be numbered in a single month than were numbered during the entire 31 years the Minor Planet Center was located in Cincinnati! For example, there were 868 pages of *MPCs*, 1464 pages of *MPSs* and 501 new numberings in the 2000 Jan. 24 batch. While there does seem to be value in continuing to have some kind of printed publication, the monthly postage bill is increasing (almost exponentially, it seems), and the necessary increase in subscription rates to keep up with this would probably be prohibitive for the majority of our subscribers. Donations are, of course, very welcome! Given that the summary of the observations contained in the *MPCs* is proving to be quite popular, the obvious next step is to summarize there the orbital calculations in some fashion, with the detailed results, including residuals, also included in a *Supplement*. Suggestions from interested subscribers are also welcome.

The following listing is a continuation to that on *MPC* 38241. The longitudes λ are measured in degrees eastward from Greenwich, and the parallax constants $\rho \cos \phi'$ and $\rho \sin \phi'$ are the product of the geocentric distance (in earth equatorial radii) and the cosine and sine, respectively, of the geocentric latitude.

OBSERVATIONS OF MINOR PLANETS

The summary lists, for each observatory code, the designation of each object observed (an asterisk signifying a new discovery), with three numbers indicating the number of observations, the number of different nights on which the object was observed and the arc (in days) covered by the observations; at the end of each observatory listing there is a count of the total number of observations, of the number of objects and of the number of discoveries followed by an asterisk, together with the total range of dates covered by the observations.
