EDITORIAL NOTICE

The Editorial Notice a month ago (*MPC* 43737–43759) prompted some discussion, notably among the community of mainly amateur astronomers who subscribe to the “Minor Planet Mailing List”. In stressing the perceived “right” of discoverers to name the minor planets they find, and whether or not the 10 million observations currently in the Minor Planet Center’s files represent a mere “database-management” problem, most of the discussion rather missed the point. The point is that, while there have been great strides in artificial intelligence in recent years, and while the MPC’s computers are open 24/7 to receive observations, computers *do* require human agents to keep them running, and the MPC’s problem is a shortage of personnel for even 16/7 operation, with most importantly a need for a systems manager/engineer. Not only has the greater-than-exponential increase in the influx of observations in recent years made the need for additional staff imperative, but without serious financial support—soon—the MPC will have to introduce cutbacks in its operation, even to the point of a reduction in staff.

If cutbacks are to be a consideration, discussion should center on priorities for the MPC operation as a whole. Given the potential danger to the survival of the human race, it seems appropriate to continue to give highest priority to the processing of information on NEOs, particularly by means of the very successful NEO Confirmation Page and rapid formal *MPEC* announcement of confirmed NEO discoveries (but do further follow-up observations of NEOs need to be disseminated seven days a week, and if there is indeed a potential danger, why are the world’s governments not clamoring to provide financial support?).

From a scientific point of view, it is also reasonable that the MPC should continue to work with the community interested in TNOs, given the exciting insight these bodies provide on the origin and evolution of the solar system (and is it more important to register hundreds of weak two-night discoveries or to ensure dozens of secure second-opposition recoveries and meaningful orbit determinations?). Since early 2000, the MPC has provided similar services involving the outer satellites of the giant planets, conveniently in time for the recognition of numerous new satellites of Jupiter and Saturn (and the same parenthetical question can be asked). Since 1978, and working closely with the Central Bureau for Astronomical Telegrams in the interests of efficiency, the MPC has taken over from the CBAT the routine filing of astrometric observations and orbital information for comets, leaving the CBAT principally with the responsibility for announcing new discoveries (but is it necessary to continue to give special attention to non-NEOs suspected to be comets from their

orbital computations but where observational confirmation is often both difficult and confusing, and why should there be any urgency in dealing with comets found near the sun by the SOHO mission that no longer even exist by the time the measurements become available?).

Of course, more than 99 percent of the objects handled by the MPC are main-belt minor planets. Although the vast majority of the observations are nowadays extracted from the immense amount of data provided by the principal NEO search programs, most of the actual observers of these objects are amateur astronomers who overwhelmingly concentrate on main-belt minor planets. Observation for observation, it is much more efficient for the MPC to process a daily set of organized but unidentified observations from an NEO program that may number in the tens of thousands than to deal with scores of e-mails daily from individual observers each containing at most a dozen or so observations of main-belt objects. While there has been very little comment either way on the suggestion last month that a small charge per e-mail submission and/or a *very* small charge per observation should be levied, the fact is that such charges could support *most* of the processing (including sometimes the need for e-mail interchanges) of the data at the MPC. While one can indeed argue whether there is much real scientific value in the reliable identifications and orbit determinations that nowadays eventually contribute to the enormous rate of new numberings of minor planets, to utilize for this purpose organized all-sky observations to a consistent magnitude limit does minimize selection effects. Rather than produce ever more routine astrometry, does it not now make some sense for many amateur astronomers instead to carry out careful photometry on a more limited selection of main-belt objects? And while there is understandable appeal to naming a minor planet of which one has been credited as the discoverer, has not the CCD revolution all but eliminated the very concept of “discovery” in an automated observing process that is then supplemented by a computer revolution that automatically yields identifications and renders the orbital solutions more and more routine the more complete and extensive the observational set becomes? While it is appropriate to acknowledge in the *MPCs* those individuals who collectively contribute to this broad observing and computing collaboration, the MPC has this past month been making a start on removing the assignment of credit to individuals (as opposed to projects) for the computational work on specific objects.

It is also necessary to consider the priority that should be given to the free services the MPC provides in the WWW. Part of the reason the Nov. 1 *MPCs* were a “mini” batch was an urgent need to repair some of these services around the time of full moon when the lull in observational activity normally provides an opportunity for

the *MPCs* to be prepared and the observations documented and filed. In response to requests from other orbit computers for the more rapid dissemination of observations of main-belt objects, the MPC early this year instituted a procedure whereby “mid-month” batches of *MPSs* can be issued with observations that have been checked but not yet documented and filed. “Mid-month” is a loose term that can also apply to *MPSs* issued almost simultaneously with a “mini” batch of *MPCs*, such a batch being one that contains none of the time-consuming documentation (and therefore also does not involve the extensive filing) of observations and orbits of minor planets. While the MPC thought that orbit computers would appreciate this availability of the observations, it appears that what the orbit computers really want is the *filing* of the observations—as evidenced by the note during the past month in the website of one of these computers to the effect that “the data from the Minor Planet Center are not available in the required format to be processed automatically”. We regret the inconvenience. Likewise, it was not possible this past month to add to the provision in the WWW of the “one-night stands”, which are the single-night detections of the almost exclusively main-belt minor planets remaining at any time after all the known identifications and night-to-night linkages have been removed. Although the MPC has received further negative comments about this, it has seen no evidence that any *use* has in fact been made of the 12 000 ONS observations made available by ftp in October. Nevertheless, while it is anticipated that, like most of the world’s astronomers, each MPC staff member will be on leave for some part of December, it is hoped that it will be possible to add to the ONS entries already available shortly. The extreme attention accorded nowadays to the dissemination (but a disinclination to support the work financially) of fully routine astrometric observations of main-belt minor planets is hard to fathom, given the disdain in which this subject was held during almost the whole of the twentieth century. Indeed, in discussing the announcement of (433) Eros, the first asteroidal NEO, A. C. D. Crommelin (1898, *The Observatory* **21**, 370) began: “The discovery of a new minor planet is hailed as a rule with equanimity, not to say indifference. The number has grown so large, and they are for the most part of so little practical importance in astronomy, that but few observers care to devote themselves to search for them.”

With 2013 new numberings, the ranks of the highest-quality orbit determinations are *today* being swollen by almost five times as many minor planets as were known when Crommelin wrote the above words. The new total, (32729), represents a doubling during the past 15 months alone. Today’s *MPO* batch also contains some 34 000 orbit determinations of lower quality. Furthermore, in documenting the data that appeared in the *MPS* batches dated Oct. 21, Nov. 3 and Nov. 17, as well as today, the current *MPC* batch refers to more than 1.1 million observations.

The MPC takes some encouragement in the fact that there have been this past month several new subscribers, particularly to the Computer Service the MPC shares with the CBAT. Although this does not make up for the continuing net reduction in the number of subscribers, even during the past six months, the MPC hopes that other newcomers will subscribe, particularly to the Extended Computing Service (where the *MPCs*, *MPSs*, *MPOs* and filed observations are available)—or to the printed *MPCs*, anachronistic though these nowadays may be. The MPC is also happy to acknowledge the receipt of donations in November from J. Schiff (New Zealand) and from M. Trueblood and R. Crawford (Arizona).

OBSERVATIONS OF MINOR PLANETS

The summary lists, for each observatory code, the designation of each object observed (an asterisk signifying a new discovery), with three numbers indicating the number of observations, the number of different nights on which the object was observed and the arc (in days) covered by the observations; at the end of each observatory listing there is a count of the total number of observations, of the number of objects and of the number of discoveries followed by an asterisk, together with the total range of dates covered by the observations.

SUMMARY OF NEW NUMBERINGS

The following summary of new numberings of minor planets lists for each object the number, principal provisional designation, date of discovery, observatory code of the discovery site and the names of the discoverers. A separate table lists orbital elements and absolute magnitudes (the slope parameter *G* being 0.15 in every case). Further details, including additional identifications and residuals, are given in the *Minor Planet Circulars Orbit Supplement*.

Discovered 1991 Aug. 9 by K. Watanabe at JCPM Sapporo Station.

Kyong Chol Chou (b.1929) is one of the leading astronomers in Korea. After working at NASA and the U.S. Naval Observatory, he now teaches at Kyunghee University and is active in astronomical research and popularization. The name was suggested by K. Hurukawa.

(9744) Nielsen = 1988 JW

Discovered 1988 May 9 by C. S. and E. M. Shoemaker at Palomar.

As the physician responsible for the mental and physical fitness of a close-knit team of researchers, construction workers and support staff at the Amundsen-Scott South Pole research station, Jerri Nielsen (b.1952) is noted for her friendship and concern for the “Polies” and her courage to face her own serious illness.

(11352) Koldewey = 1997 WP₂₂

Discovered 1997 Nov. 28 by the OCA-DLR Asteroid Survey at Caussols.

Eberhard Koldewey (b.1937), at the DLR Institute of Space Sensor Technology and Planetary Exploration, contributed to the upgrade of the Bochum telescope at the European Southern Observatory, where he participated in many observing campaigns on minor planets. The naming is on the occasion of his retirement.

(12225) Yanfernández = 1985 PQ

Discovered 1985 Aug. 14 by E. Bowell at the Anderson Mesa Station of the Lowell Observatory.

Yanga R. Fernández (b.1971) completed his thesis on the albedo and size distribution of cometary nuclei at the University of Maryland in 1999. Since then, at the University of Hawaii, he has measured albedos of other small bodies, recovered comets and discovered new jovian satellites. The name was suggested by M. F. A’Hearn.

(12226) Caseylisse = 1985 TN

Discovered 1985 Oct. 15 by E. Bowell at the Anderson Mesa Station of the Lowell Observatory.

Carey M. (“Casey”) Lisse (b.1961) is an expert on cometary dust and has made significant contributions to understanding the size distribution of the dust using infrared observations. The name was suggested by M. F. A’Hearn.

(12284) Pohl = 1991 FP

Discovered 1991 Mar. 17 by E. F. Helin at Palomar.

Frederik Pohl (b.1919) is a U.S. science-fiction writer whose vivid imagination and stirring tales took readers to the moon, Venus, Mars, the Oort Cloud and black holes. The name was suggested by D. Brin.

(13689) Succi = 1997 RO₇

Discovered 1997 Sept. 9 by V. Giuliani at Sormano.

Carlo Succi (1919–2000), a professor of physics at the University of Milan, was also director of the local section of the Istituto Nazionale di Fisica Nucleare. His interests ranged from a pioneering study of cosmic rays to the development of the Milan 50-MeV cyclotron.

(14395) Tommorgan = 1990 TN₃

Discovered 1990 Oct. 15 by E. F. Helin at Palomar.

U.S. planetary scientist Thomas H. Morgan (b.1945) is also Near-Earth Objects and Minor Planets Program Scientist at NASA Headquarters. In the latter capacity he has been very supportive of the efforts to discover and track near-earth objects.

(17518) Redqueen = 1992 YD

Discovered 1992 Dec. 18 by A. Natori and T. Urata at the JCPM Yakiimo Station.

The Red Queen is one of the chess pieces that make up the characters in Lewis Carroll’s *Through the Looking Glass and what Alice found there*. Alice has some very strange experiences and conversations with her.

(19629) Serra = 1999 RV₃₁

Discovered 1999 Sept. 8 by A. Klotz at Guitalens.

Catalan astrophysicist Guy Serra (1947–2000) was an active pioneer in the field of infrared and submillimeter space astronomy throughout Europe. The discoverer received his doctorate under Serra’s direction.

(24899) Dominiona = 1997 AU₁₇

Discovered 1997 Jan. 14 by G. C. L. Aikman at the Dominion Astrophysical Observatory, Victoria.

Canada is officially the “Dominion of Canada” under the Constitution Acts of 1867 and 1982. Such designation was inspired by Psalm 72, verse 8: “He shall have dominion also from sea to sea, and from the river unto the ends of the earth.”

(25628) Kummer = 2000 AZ₅₀

Discovered 2000 Jan. 7 by P. G. Comba at Prescott.

Ernst Eduard Kummer (1811–1893) was a professor at the Universities of Breslau and Berlin. He spent many years working on Fermat’s last theorem and obtained a partial proof of it. In the process he developed some important concepts in algebra.

(25890) Louisburg = 2000 VG₃₈

Discovered 2000 Nov. 3 by L. Robinson at the Sunflower Observatory.

Louisburg, Kansas, is the home of Powell Observatory, a public observatory owned and managed by the Astronomical Society of Kansas City.

(26119) Duden = 1991 TN₇
