EDITORIAL NOTICE

The recognition that the “centaur” 2004 PY₄₂ is a comet (cf. *IAUC* 8545) brings up the inconsistency that the usual rules imply that, as a comet, this object will not qualify for receiving a P/ number until after it passes aphelion in the 2030s, whereas if it had “remained” a minor planet—until someone noticed its cometary activity next year, say—it would have qualified for numbering at the present opposition. Indeed, under that circumstance, 2004 PY₄₂ would presumably have received “dual status”, like the prototype centaur (2060) = 95P/Chiron. The purpose of comet numbering is to produce a consistent set of generally predictable comets (except for the few well-known cases of previously well-observed comets with D/ prefixes that now no longer seem to exist), and that is best accomplished by requiring observations at two (or more) perihelion passages.

With their large perihelion distances (and evident large sizes), “centaur comets” would seem less likely (over a rather considerable timespan) than the more typical short-period comets either physically to disappear or to experience significant non-gravitational effects in their motions. It therefore seems reasonable to use the same criteria for numbering both “cometary” and “asteroidal” centaurs (and, for that matter, TNOs), namely, orbital quality $U \leq 3$ and observations at four or more oppositions (at least one of which is recent). Accordingly, C/2004 PY₄₂ is being numbered 167P in the current batch of *MPCs*, as also are C/2000 B4 = 165P and C/2001 T4 = 166P. Compilers of lists of centaurs are therefore advised to include these objects in their lists. Of course, following cometary “tradition”, the names of these three centaurs are those of their discoverers (or, rather, discovery programs), rather than the mythological centaur names of the tradition for minor planets. There does not seem to be an easy resolution to this particular dilemma, other than to concentrate on referring to objects by their numbers and provisional designations, rather than by their names.

Following the 3rd Release of the *Sloan Digital Sky Survey Moving Object Catalog* (containing astrometric and photometric data for 204 305 moving objects observed prior to June 2004), the Minor Planet Center is replacing in its files (without republication in the *MPS*) a total of 111 534 observations of minor planets.

NEW OBSERVATORY CODES

The following listing is a continuation to that on *MPC* 54101. The longitudes λ are measured in degrees eastward from Greenwich, and the parallax constants $\rho \cos \phi'$ and $\rho \sin \phi'$ are the product of the geocentric distance (in earth equatorial radii) and the cosine and sine, respectively, of the geocentric latitude.

SUMMARY OF NEW NUMBERINGS

The following summary of new numberings of minor planets lists for each object the number, principal provisional designation, date of discovery, observatory code of the discovery site and the names of the discoverers. A separate table lists orbital elements and absolute magnitudes (the slope parameter G being 0.15 in every case). Further details, including additional identifications and residuals, are given in the *Minor Planet Circulars Orbit Supplement*.
